

EXPT NO:04	PERFORM IT PROJECT AUDIT AND GENERATE A REPORT USING OPEN-SOURCE TOOLS
------------	---

AIM:

To perform an IT project audit using open-source tools by examining project activities, identifying risks and issues, evaluating compliance and performance, and generating a comprehensive audit report.

ALGORITHM:

- Start the open-source IT project auditing tool.
- Create or import the IT project to be audited.
- Collect project information such as scope, schedule, resources, cost, and deliverables.
- Define the audit criteria and objectives.
- Examine project documentation, processes, and activities.
- Identify risks, issues, deviations, and compliance gaps.
- Evaluate project performance against the defined criteria.
- Record audit findings with their severity and recommendations.
- Generate the IT project audit report containing findings, risks, and corrective actions.
- Review and save the final audit report, then stop.

PROCEDURE:

- Open the selected **open-source** IT project auditing tool and create a new audit project.
- Enter the project details such as **project name, objectives, team, timeline, and deliverables**.
- Define the **audit scope, objectives, and evaluation criteria**.
- Import or enter relevant project documents, task details, schedules, and resource information.
- Review the project activities and compare the actual progress with the planned progress.
- Check the project for **risks, security issues, quality problems, cost deviations, and schedule delays**.
- Record each identified finding and assign an appropriate **severity level** such as Low, Medium, or High.
- Provide suitable recommendations and corrective actions for the identified issues.
- Generate the IT Project Audit Report containing project details, audit findings, risk levels, recommendations, and overall assessment.
- Review the generated report, save/export it, and verify that the audit results are complete and accurate.

OUTPUT:

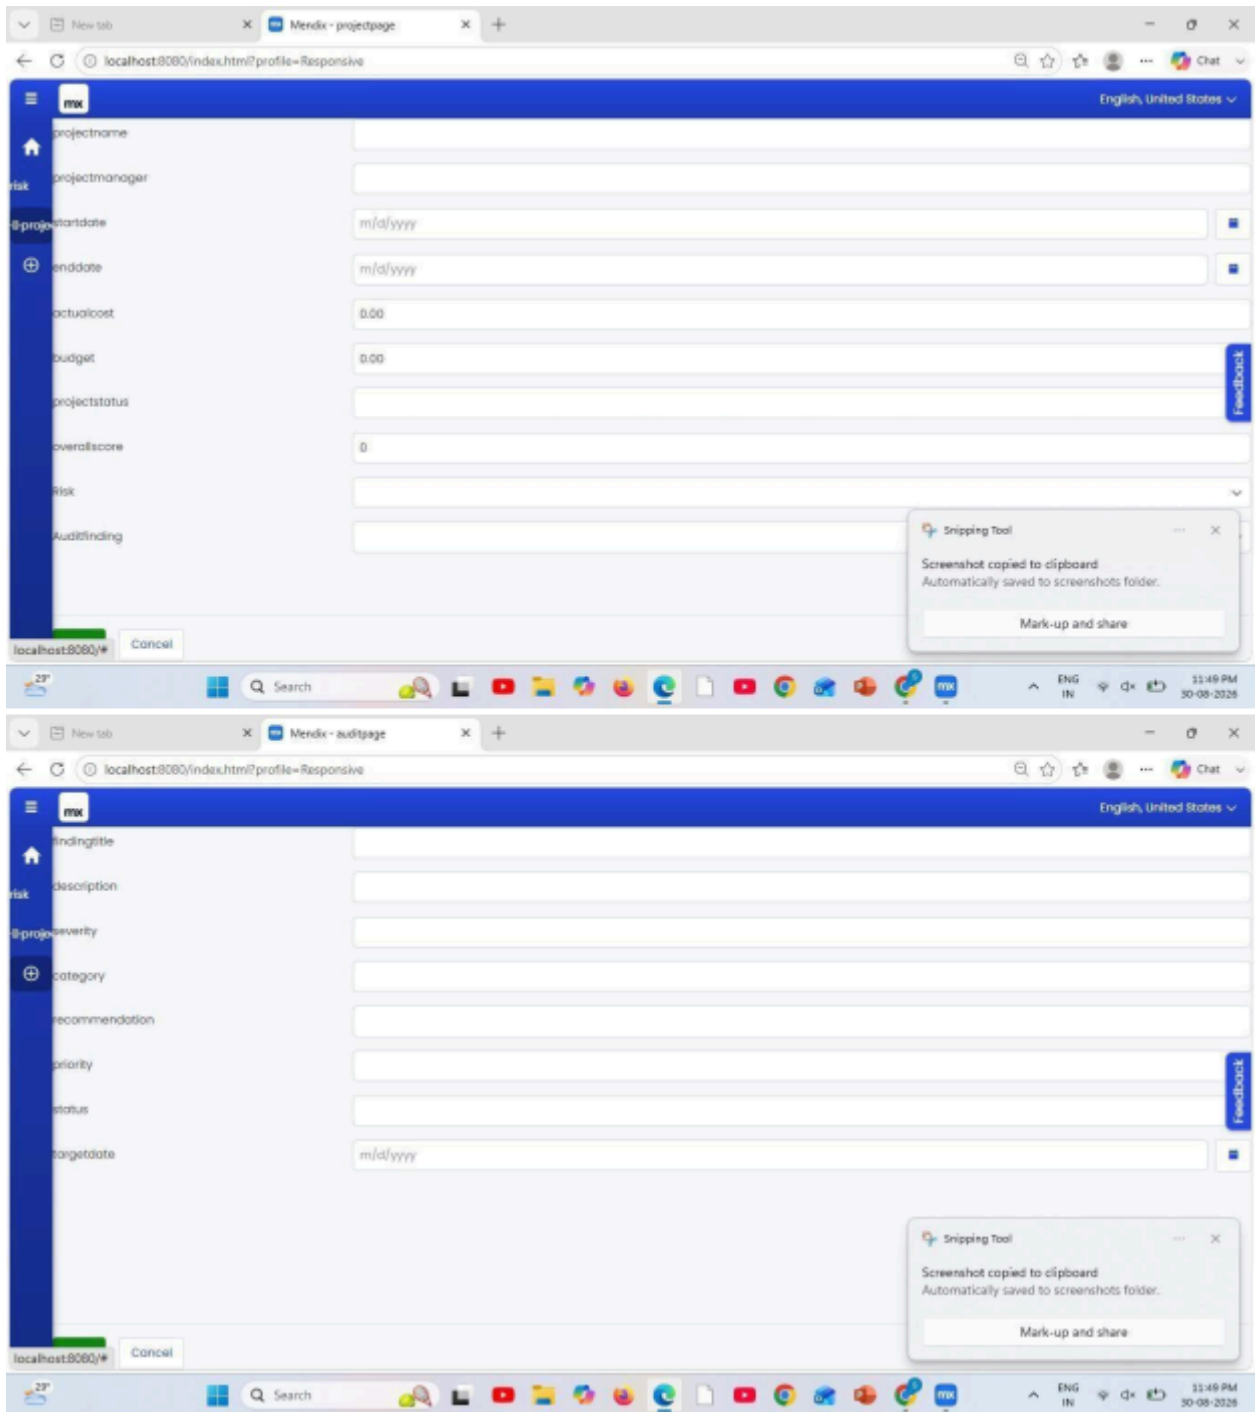

The image displays two screenshots of the Mendix IDE interface, showing the progression from the homepage to a form editor.

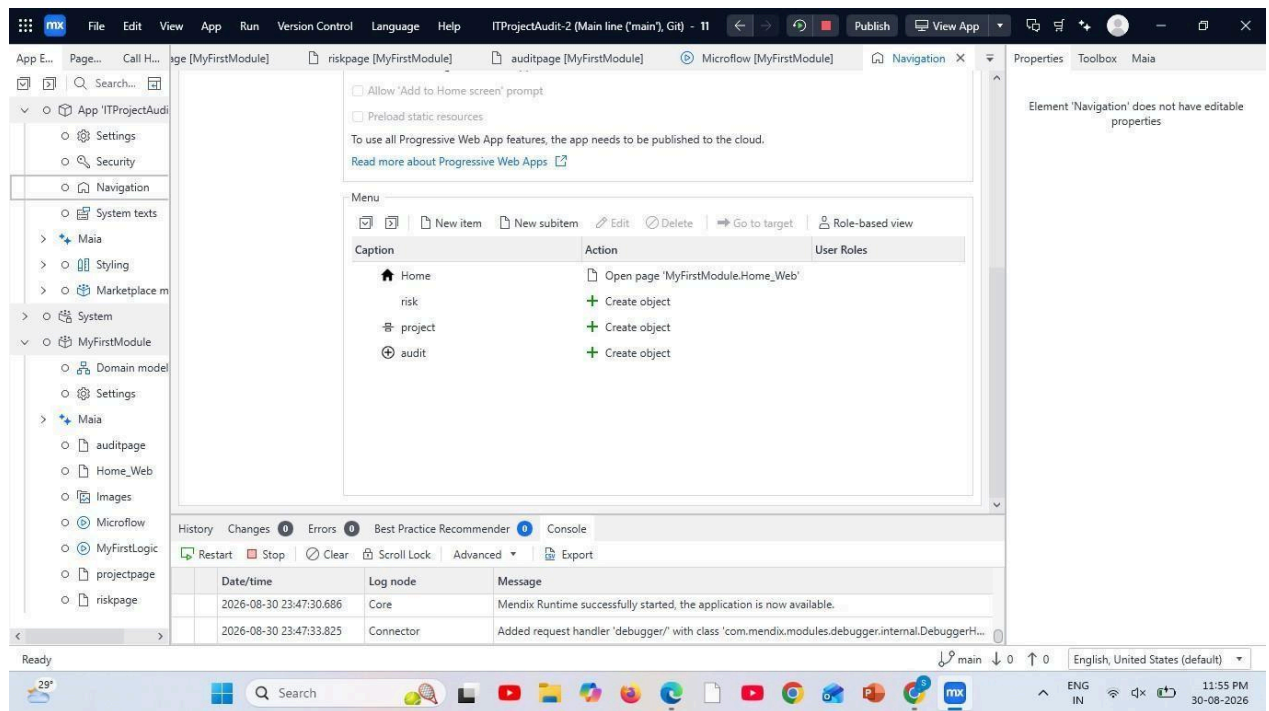

Top Screenshot: Mendix - Homepage

- Navigation Bar:** Home, risk, project, audit. Language: English, United States.
- Header:** Welcome to your homepage
- Step 1: Define and organize your data**
 - Start by setting up your Domain Model, where you define the data structure for your app. This includes creating entities, attributes, and associations.
 - Domain model diagram:** Shows two entities, 'YourEntity' and 'YourEntity2', connected by an association. The 'YourEntity' entity has attributes 'YourEntity.String' and 'YourEntity.String'. The 'YourEntity2' entity has attributes 'YourEntity2.String' and 'YourEntity2.String'.
 - Text: A well-structured Domain Model forms the foundation for the components and pages you'll build next.
 - Link: [Learn more](#)
- Step 2: Add and connect widgets to your page**
 - your data in place, start building your page by dragging widgets from the toolbox onto the canvas. Connect them to your data to make your app interactive and dynamic.

Bottom Screenshot: Mendix - riskpage

- Navigation Bar:** Home, risk, project, audit. Language: English, United States.
- Form Editor:** A form with the following fields:
 - riskname: Text input
 - description: Text input
 - probability: Text input (value: 0)
 - impact: Text input (value: 0)
 - riskscore: Text input (value: 0)
 - mitigationplan: Text input
 - riskstatus: Text input
- Buttons:** Save, Cancel

RESULT:

The IT project is successfully audited using an open-source tool, and a comprehensive audit report containing the project findings, risks, issues, and recommendations is generated.
